                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                The present sequence is that of a phytoene desaturase (PD) isolated from Nicotiana benthamiana. The PD is used for the biosynthesis of zeta-carotene which is useful in the carotenoid biosynthesis pathway. Carotenoids such as phytoene have been found to be useful in absorbing ultraviolet radiation, and lycopene has use as a colouring agent in situations in which a red colour is desired.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of a phytoene desaturase (PD) isolated from Nicotiana benthamiana.                                                                                                                                                                                                                                                                                                                                                           ಭ
                                                                                                                                                                                                                                                                                                                                      The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA00010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, mematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity includiatory activity and activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytokine; cell proliferation; cell differentiation; gene therapy;

The sequence is that of the polypeptide encoded by a region isolated from S. pneumoniae which shows homology to phospho-2-debydro-3-deoxyheptonate aldolase. It, or agonists of it, may be useful as an antibacterial for treatment or prevention of infection, specifically caused by S. pneumoniae (particularly meningitis) but possibly also Helicobacter by S. pneumoniae (particularly meningitis) but possibly also Helicobacter use before insertion of an in-dwelling device or any other invasive procedure. The protein, or nucleic acid encoding it, can also be used in vaccines to induce a cellular and/or humoral immune response, or to screen for other antibacterials. The DNA may also contain flanking sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
New isolated nucleic acids from Streptococcus pneumoniae - useful, e.g. for identifying anti-bacterial(s) for treatment and prevention
                                                                                                                                                                                                                                                                                                                                     that are potential sources of control elements for bacterial gene expression. Detecting a sequence encoding the protein can be used diagnostically, e.g. to detect a mutation for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;
                                                                                                                                                                                                                                                                                          The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, heematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wlpo.int/pub/published_pct_sequences.

activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PAP DNA has a high bacteria-aggregating activity and is useful for the prepn. of PAP which can act as a proteinaceous antibacterial agent. Total RNA was isolated from mouse. It was hybridised with modified salmon spermatcaca DNA and known rat PAP cDNA as a probe. Two primers are given in AAQ64173-74.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human and mouse pancreatitis-associated protein (PAP) - useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pancreatitis-Associated Protein; PAP; mouse; human; bacteria;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human polynuclectides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or which may induce production of other cytokines in other cell populations. The polynuclectides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, activity, tissue growth factor activity, immunomodulatory activity and

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), appressed DNA (ABB57737-ABB22072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis). Uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory in the sasociated with acne vulgaris. A method for detecting the resence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention of polypeptides may be used as antigens in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downrequiate expression and activity of P. acnes pulpaptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by onzyme linked immunosorbent assay (ELISA).

Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO. It the wipo.int/pub/published_pct_sequences.

Neurochem. 64:2339-2344(1995).
-!- FUNCTION: NOT KNOWN, BINDS CALCIUM.
-!- SUBCELLULAR LOCATION: Endoplasmic reticulum lumen.
-!- TISSUE SPECIFICITY: UBIQUITOUS.
-!- SIMILARITY: BELONGS TO THE RETICULOCALBIN FAMILY.
-!- SIMILARITY: CONTAINS 6 EF-HAND CALCIUM-BINDING DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB 1; Length 318;

FUNCTION: BINDS TO MOB ELEMENTS (MLU I CELL CYCLE BOX) FOUND IN THE PROMOTER OF MOST DNA SYNTHESIS GENES. TRANSCRIPTIONAL ACTIVATION BY MBF HAS AN IMPORTANT ROLE IN THE TRANSITION FROM GI TO S PHASE. IT MAY HAVE A DUAL ROLE IN THAT IT BEHAVES AS AN ACTIVATOR OF TRANSCRIPTION AT THE G1-S BOUNDARY AND AS A REPRESSOR SUBURING OTHER SYNEGES OF THE CELL CYCLE.

SUBUNIT: MBF CONTAINS SWIF AND MBP1.

J. BLOCHEM. 209:399-407 (1992).

FUNCTION: THIS ENZYME CONVERTS PHYTOENE INTO ZETA-CAROTENE VIA INTERMEDIARY OF PHYTOFLUENE BY THE SYMMETRICAL INTRODUCTION OF DOUBLE BONDS AT THE C-11 AND C-11' POSITIONS OF PHYTOENE.

COFACTOR: NAD, NAPP, OR FAD (PROBABLE).

ENZYME REGULATION: INHIBITED BY THE HERBICIDES METFLURAZON, DIFUNDANE, FULNIDOME AND DIFLUFENICAN.

BATHWAY: CAROTENOID BIOSYNTHESIS.

SUBCELLULAR LOCATION: Chloroplast; chromoplast.

DEVELOPMENTAL STAGE: RIPENING FRUIT.

Submitted (JAN-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: HYDROLYSIS OF THE DEOXYRIBOSE N-GLYCOSIDIC BOND TO
EXCISE 3-METHYLADENINE OR 7-METHYLADENINE FROM THE DAMAGED DNA
POLYMER FORMED BY ALKYLATION LESIONS (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: Hydrolysis of alkylated DNA, releasing 3-
methyladenine, 3-methylguanine, 7-methylguanine, and 7-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16-OCT-2001 (Rel. 40, Created)

. Mol. Genet. 6:869-876(1997).
FUNCTION: RECEPTOR FOR OBESITY FACTOR (LEPTIN).
SUBCELLULAR LOCATION: TYPE I membrane protein.
SIMILARITY: CONTAINS 3 FIBRONECTIN TYPE III-LIKE DOMAINS.
SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EXTRACELLULAR (POTENTIAL)
